Company Recruitment Team *August 6, 2021*

COMPANY ADDRESS

Job Application for <such and such> role

Dear Mr./Ms./Dr. LastName,

About Me

Give a brief overview of my situation (recently completed PhD in particle physics, with a first class masters degree in physics with astrophysics), personality, and goals in reference to the advertised job (e.g., that I'm excited to join and prove myself, etc.).

Why Google?

Write a few sentences on why I am applying to the company, specifically. What I like about them, and why they would be good to work for, etc. (could pull some things from the job spec. if it lists benefits).

Why Me?

The most important bit. Show how the experience and skills I've obtained so far (from PhD, teaching, undergrad) are suitable for the job and make me a good candidate. These can include specific technical skills (programming in various languages and with various Python libraries, distributed computing, physics research, cutting edge particle physics) and more general, but useful skills (communication from scientific writing and conference speaking, collaboration from working in several small and large groups of multinational researchers). Try to give specific examples of things, e.g., quickly learning ins and outs of detector for trigger/on call shifts, applying all my knowledge and skillsets in my PhD to achieve world leading results for Higgs boson to invisible state branching ratio, giving several large/conference level talks on behalf of the people in my group (i.e., not necessarily work I'd done, so requires lots of liaising with people and disseminating their contributions that I'm not an expert in). Include keywords from job spec. where possible.

Sincerely,

Eshwen Bhal
